Tine Weeder

This is the Lely Tine Weeder for "blind" cultivation, which makes no distinction between crops and weeds, except when you use it after either one sprouts. We specialize in set-ups for raised beds, which includes Furrow Shanks to cultivate furrows at the same time. Tine Racks are available in different widths to match your bed width. Full-width flat-bed Tine Racks are also available special-order.

Tine spacing is 1-1/2" across four ranks. Adjust down pressure on each Tine or raise up when needed. Cultivator shanks can be mounted through the Tine Rack to combine other tools with Tine Weeders. A 4-bar toolbar frame is required to install Rack.

Tine Weeders are trendy for blind cultivation within the first few weeks of crop growth. Tines break up a thin crust to dry out sprouting weeds. After sufficient growth, depending on the crop, tines can operate in-row. This will not root out established weeds. Tines may not penetrate soils that develop a thicker crust.

Beginner info: Tine Weeders are highly specialized to use early and often after crop sprouts. By no definition is this tool equivalent to Shovels, Hoes or Spider Wheels.

Finger Weeders

Finger Weeders are the next step up for in-row cultivation. Keep in mind if this was easy, everybody would be doing it. Experimenting with these products before the full investment is recommended. We can mount allied products on our toolbars. Please inquire.

Basket Weeders

This is popular for shallow cultivation between several rows spaced close together, perhaps for garlic, onions, carrots or radishes. This customized hardware is practical to set-up on a dedicated toolbar. We can mount allied products on toolbars with Furrow Shanks for raised beds. Please inquire.
